1,627 contributions in the last year

This data visualization is from GitHub. These blocks represent different days in a year. One column represent a week and each row represent a day in a week. The legend in the lower right corner gives an idea about lighter green represent more contribute and darker represent less.

The good part of this data visualization is it can intuitively show when and how much I have contributed in the past years. Places where greens are more obvious shows a period when I made a lot contributions to these repos.

Some unpleasing part about this graph is it can only show a range of contributions made in a day. There is no quantitative representation of how many contributions I made in a day. Also, the brightest green can be vary from maybe 10 to one 1000. So it can not be shown on the graph even if I made a lot of changes in one day.
